## ABSTRACT OF THE DISCLOSURE

Disclosed herein is an immunoassay comprising  
reacting an immobilized antibody obtained by holding an  
antibody, which recognizes a part of an objective antigen  
of determination, on insoluble carrier particles with an  
antigen in a test specimen, then reacting a free antibody,  
which recognizes an antigen site different from that  
recognized by the immobilized antibody, with the antigen;  
or reacting a free antibody, which recognizes a part of  
an objective antigen of determination, with an antigen in  
a test specimen, then reacting an immobilized antibody  
obtained by holding an antibody, which recognizes an  
antigen site different from that recognized by the free  
antibody, on insoluble carrier particles with the antigen,  
and optically determining the degree of a change in  
agglutination occurred by the reaction.

The immunoassay of the invention has advantages  
that it has high specificity and is simple and low in  
cost, and with respect to the antibodies used, insofar as  
one of the immobilized antibody and the free antibody has  
high specificity for the objective antigen of  
determination, the other antibody does not need to have  
strict specificity and may have some cross-reactivity.
